

Assignment 7: GLMs (Linear Regressios, ANOVA, & t-tests)

Elizabeth Good

Fall 2023

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file `<FirstLast>_A07_GLMs.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change “Student Name” on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (NTL-LTER_Lake_ChemistryPhysics_Raw.csv). Set date columns to date objects.
2. Build a ggplot theme and set it as your default theme.

```
#1
# load in needed packages
library(tidyverse)

## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
## v dplyr      1.1.3      v readr      2.1.4
## v forcats    1.0.0      v stringr   1.5.0
## v ggplot2    3.4.3      v tibble    3.2.1
## v lubridate  1.9.2      v tidyr     1.3.0
## v purrr      1.0.2
## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()     masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors

library(lubridate)
library(here)

## here() starts at C:/Users/goode/OneDrive/Documents/Duke/ENV872_EDE/EDE_Fall12023
```

```

library(agricolae)

# verify home directory
here()

## [1] "C:/Users/goode/OneDrive/Documents/Duke/ENV872_EDE/EDE_Fall2023"

# read in raw data
lake.chem.physics <-
  read.csv(
    here("Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv"),
    stringsAsFactors = TRUE)

#date columns as date objects
class(lake.chem.physics$sampldate)

## [1] "factor"

# currently class factor

lake.chem.physics$sampldate <-

#2
new_theme <- theme_bw() +
  theme(axis.text = element_text(color = "navy",
                                size = 12),
        axis.title = element_text(color = "gray40",
                                size = 12),
        plot.title = element_text(color = "gray40",
                                face = "bold",
                                hjust = 0.5),
        legend.position = "bottom")

theme_set(new_theme)

```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: The slope (beta) between lake temp and depth is equal to zero. Ha: The slope (beta) between lake temp and depth is not equal to zero.

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

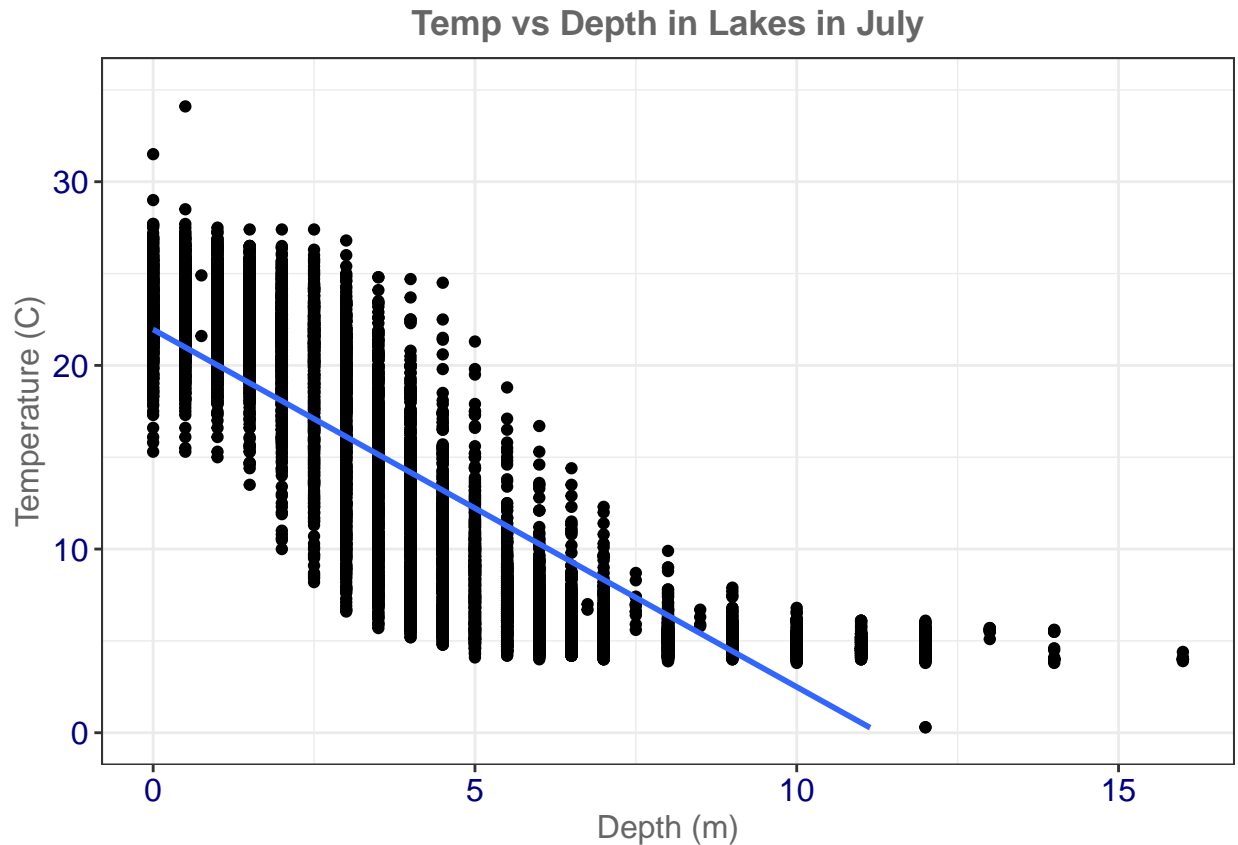

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

```
#4
lake.wrangled <- lake.chem.physics %>%
  mutate(Month = month(sampledate)) %>%
  filter(Month == 7) %>%
  select(c(lakename,
           year4,
           daynum,
           depth,
           temperature_C)) %>%
  na.omit()

#5
TempbyDepth <-
  ggplot(lake.wrangled,
         aes(x = depth,
             y = temperature_C)) +
  geom_point() +
  ylim(0, 35) +
  ggtitle("Temp vs Depth in Lakes in July") +
  xlab("Depth (m)") +
  ylab("Temperature (C)") +
  geom_smooth(method = "lm")
print(TempbyDepth)
```

```
## 'geom_smooth()' using formula = 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values ('geom_smooth()').
```

6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

Answer: Temperature decreases as depth increases. This relationship is mostly linear when depth is below about 8m, but there comes a point that as depth continues to increase, the temperature stays constant around 5C.

7. Perform a linear regression to test the relationship and display the results

```
#7
temp.regression <-
  lm(lake.wrangled$temperature_C ~
      lake.wrangled$depth)
summary(temp.regression)

##
## Call:
## lm(formula = lake.wrangled$temperature_C ~ lake.wrangled$depth)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -9.5173  -3.0192   0.0633   2.9365  13.5834
##
## Coefficients:
```

```
##               Estimate Std. Error t value Pr(>|t|)
## (Intercept)      21.95597    0.06792   323.3  <2e-16 ***
## lake.wrangled$depth -1.94621    0.01174  -165.8  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF, p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

Answer: 73.87% of the variability in temperature is explained by changes in depth based on 9726 degrees of freedom, and this relationship is statistically significant ($p < 2e-16$). A 1m increase in depth results in a 1.94621 degree C drop in temperature. We're rejecting the null hypothesis and concluding that there is a significant relationship between temperature and depth.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.
10. Run a multiple regression on the recommended set of variables.

```
#9
tempAIC <- lm(data = lake.wrangled,
              temperature_C ~ depth + year4 + daynum)

step(tempAIC)
```

```
## Start: AIC=26065.53
## temperature_C ~ depth + year4 + daynum
##
##           Df Sum of Sq    RSS   AIC
## <none>                 141687 26066
## - year4      1         101 141788 26070
## - daynum     1        1237 142924 26148
## - depth      1       404475 546161 39189
##
## Call:
## lm(formula = temperature_C ~ depth + year4 + daynum, data = lake.wrangled)
```

```
##
## Coefficients:
## (Intercept)      depth      year4      daynum
##      -8.57556      -1.94644      0.01134      0.03978

#10
temp.mlregression <- lm(data = lake.wrangled,
                        temperature_C ~ depth + year4 + daynum)
summary(temp.mlregression)

##
## Call:
## lm(formula = temperature_C ~ depth + year4 + daynum, data = lake.wrangled)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715  -0.994  0.32044
## depth       -1.946437   0.011683 -166.611 < 2e-16 ***
## year4        0.011345   0.004299   2.639  0.00833 **
## daynum       0.039780   0.004317   9.215  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic: 9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

Answer: The final set of explanatory variables the AIC suggests using to predict temperature includes depth, year4, and daynum. This model explains 74.12% of the variance in temperature, which is a slight improvement over the model only using depth as an explanatory variable.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12
# Format as aov
temp.anova <- aov(data = lake.wrangled,
                  temperature_C ~ lakename)
summary(temp.anova)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename      8  21642   2705.2     50 <2e-16 ***
## Residuals    9719 525813    54.1
## ---

```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

Answer: Yes, there is a significant difference in temperature among the lakes. In both the ANOVA and the linear models, the p-values for lake names are all statistically significant (less than 0.01).

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a `geom_smooth` (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#14.
TempbyLakename <- lake.wrangled %>%
  ggplot(mapping = aes(x = depth,
                      y = temperature_C,
                      color = lakename)) +
  ggtitle("Temp vs Depth for Lakes in July") +
```

```

scale_y_continuous(name = "Temperature (C)",
                   limits = (c(0,35))) +
scale_x_continuous(name = "Depth (m)") +
labs(color = "Lake") +
geom_point(alpha = 0.5) +
geom_smooth(method = "lm",
           se = FALSE)
print(TempbyLakename)

```

```
## 'geom_smooth()' using formula = 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values ('geom_smooth()').
```

15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15
```

```
TukeyHSD(temp.anova)
```

```

## Tukey multiple comparisons of means
## 95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = lake.wrangled)
##

```

```

16. From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

Answer: Ward and Paul Lake have the same mean temperature as Peter Lake. No lake has a mean temperature that is distinct from all the other lakes.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

Answer: If only interested in seeing if the mean temperature between two lakes was significantly different, you could run a t-test.

18. Wrangle the July data to include only records for Crampton Lake and Ward Lake. Run the two-sample T-test on these data to determine whether their July temperature are same or different. What does the test say? Are the mean temperatures for the lakes equal? Does that match you answer for part 16?

```
CramptonWard.wrangled <- lake.wrangled %>%
  filter(lakename == c("Crampton Lake",
                       "Ward Lake"))
```

```
temp.twosample <- t.test(CramptonWard.wrangled$temperature_C ~
                        CramptonWard.wrangled$lakename)
```

```
temp.twosample
```

```
##
## Welch Two Sample t-test
##
## data: CramptonWard.wrangled$temperature_C by CramptonWard.wrangled$lakename
## t = 0.98673, df = 95.77, p-value = 0.3263
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is not equal to 0
## 95 percent confidence interval:
## -1.130614 3.365610
## sample estimates:
## mean in group Crampton Lake      mean in group Ward Lake
##                15.37107                14.25357
```

Answer: According to the two sample t test, the mean temperatures in Crampton and Ward Lakes are not significantly different (p-value = 0.3262). In other words, the mean temperatures for the lakes are equal. This matches the answer for part 16, which has Crampton and Ward Lakes in the same grouping.
